

CLOUD

Using cloud-based solutions is already standard practice in most companies, regardless of their size. It is a simple and fast way to access the organization's data and information remotely and it is also very secure.

However, in home office, the cloud gains extra attention: in the event of a cyberattack on the network or data loss, the cloud is the tool that will ensure this information is not lost forever.

DIGITAL SECURITY POLICY

It is extremely important for a company to create a digital security policy for remote work, highlighting all the care and duties employees must take in this kind of work.

This document can cover all the topics listed here, in addition to some basic measures, such as:

- * Avoid sharing passwords and information with third parties;
- * Avoid sharing passwords and information through channels not formalized by the company;
- * Prevent access from people outside the organization (ideally, when using a personal computer, one should create a specific user for home office work);
- * Warn about the use of applications and systems not determined by the company;
- * Corporate email only;
- * Two-step authentication in messaging applications.

The digital security policy not only provides guidelines on how to behave but also works as a document that signs an agreement of the employee's responsibility towards the company.

ACCESS MANAGEMENT

Betting on an access management tool is, of course, a great way to protect data and strengthen a company's digital security.

This service controls and prevents third-party access to the company's private network, helps create strong passwords and allows you to securely share these passwords without running the risk of leaks, and also prevents threats and virtual attacks that can steal data.

It is a guaranteed investment that protects, prevents, and guides, making the company's digital security even stronger.

And speaking of access management, learn about and **request a demonstration of the senhasegura PAM system**. Do this and discover all the capabilities of this tool.
